

DHT™-4C

“DHT™-4C” is dehydrated Hydrotalcite-like Compound and has the unique anion-exchange property. “DHT™-4C” has been developed for use as stabilizer in the resins processing at high temperature such as engineering plastics and rubbers. “DHT™-4C” is more suitable for use in the resins processing at high temperature, because the heat resistance of “DHT™-4C” is higher than “DHT-4A™-2”.

【Typical Data】

		DHT™-4C
Molar Ratio of MgO/Al ₂ O ₃		4.25
Loss on heating (300°C × 1Hr)	(%)	4.1
Specific Surface Area (BET)	(m ² /g)	15
Particle Size Distribution		
Average	%50 (μm)	0.38

Package	NET weight
Paper bag	15 kg
